

## Smart City in a Hyperconnected Era

Wilfred Lau

### Abstract

In a networked society, all of us are spending more time on the internet with our computers and smart phones and our “connected time” is on a continual rise. With billions of people connected by mobile devices of unlimited processing power and instant access to information and knowledge, this “hyperconnectivity” (as coined by World Economic Forum) is changing the way we live, work, interact with each other and how we made decision. The Fourth Industrial Revolution will change not only what we do but who we are. With the door of IR 4.0 wide open, the opportunity is upon us to shape technology to improve people’s lives in future smart cities.

Key words: Smart city, hyperconectivity, IR 4.0
